

2. IDEATION PHASE

2.1 Introduction

The Ideation Phase defines the initial idea behind the project and identifies the business problem that needs to be addressed.

The idea for the project is based on the need to create a **structured and automated Incident Management process** for organizations using ServiceNow.

In a traditional incident-handling environment, incidents may be reported through different communication channels. This can make it difficult for support teams to maintain consistent incident records, identify the correct support group, track SLAs, and monitor the overall resolution process.

The proposed solution is to use ServiceNow to create a centralized Incident Management process where incidents can be created, classified, assigned, investigated, escalated, resolved, and tracked through a controlled lifecycle.

2.2 Identified Business Problem

The following problems were identified:

- Incidents may not be recorded consistently.
- Incident classification may be incorrect or incomplete.
- Incidents may be assigned to inappropriate teams.
- Escalation may be delayed.
- Support teams may not have easy access to existing solutions.
- Resolution information may not be properly documented.
- Recurring incidents may be difficult to track.
- Changes required for incident resolution may not be properly linked.
- SLA compliance may be difficult to monitor.
- Knowledge gained from resolved incidents may not be reused.

2.3 Proposed Idea

The proposed idea is to develop an **Incident Lifecycle Automation solution in ServiceNow** that provides a centralized and structured process for handling incidents.

The solution will:

- Create incident records.
 - Capture required incident information.
 - Classify incidents.
 - Determine priority.
 - Assign incidents to support teams.
 - Provide knowledge assistance.
 - Escalate incidents when required.
 - Allow Level 2 teams to investigate incidents.
 - Create emergency change requests.
 - Create child incidents for related issues.
 - Document causes and resolutions.
 - Generate knowledge articles from resolved incidents.
 - Track SLAs and related records.
-

2.4 Expected Benefits

The proposed solution is expected to provide:

- Standardized incident processing.
 - Improved incident tracking.
 - Better assignment and ownership.
 - Faster access to knowledge.
 - Structured escalation.
 - Better resolution documentation.
 - Integration between Incident and Change Management.
 - Reuse of knowledge from previously resolved incidents.
 - Improved SLA visibility.
 - Better overall IT service management visibility.
-

2.5 Ideation Outcome

At the end of the Ideation Phase, the project idea was defined as: **To develop an automated Incident Management solution in ServiceNow that manages the complete incident lifecycle and integrates Incident Management with Knowledge Management and Change Management.**
